ADLER-Your All-round Protection for Strong Currents!

Our professional team is a skilled and knowledge based group which endeavors to provide best and wide spectrum of technical and customer services at one stop. We at ADLER wish to establish ourselves as your number one destination for photovoltaic, industrial and electrical vehicle fuses and

accessories. We have strong foundations by which we wish to achieve robust growth. Our diversified and dedicated team of sales, product technicians and field application engineers have all needed expertise in providing you with supreme technical support and customer service.

Our products are designed for following applications:

- Photovoltaic midget and medium fuse links (gPV)
- Photovoltaic NH fuses in various sizes (gPV)
- Rail-mount fuse holder cartridges for cylindrical fuses and NH blade type fuse bases
- Photovoltaic system components, combiner boxes and parts
- DC switches, isolators, disconnects, circuit breakers
- Photovoltaic surge protection devices (SPD)

- Cylindrical fuse links for industrial applications (gG)
- All standard DIN-sized NH blade fuses for general industrial application (gG)
- Fuse holders for cylindrical fuses, fuse mounts and NH blade type fuse bases
- MV and HV power current limiting fuse links, CEF type
- HV fast acting semiconductor fuses

- Special EV type cylindrical fuses for EV chargers and battery storage systems
- BS88 cartridge fuses
- EV fuse bolt mounts and holders

Across all of our product range, we are proud to represent established, certified products that have developed a reputation for quality, reliability and innovation. Please refer to our brand and datasheets available from our website for a more detailed overview of our products.

We provide our customers with solutions expertise, a high standard of personalized service, availability of stock and an 'easy to deal with' experience.

Our Mission Statement

We add value to our customer's business by supplying quality specialist electrical products, solutions-focused expertise, personal service and genuine customer care at highest possible standards in our industry.

Our Location:

ADLER Elektrotechnik Leipzig GmbH
Zschochersche Str. 9104229 Leipzig

PV – Fuse Selection Guide

For any PV systems with arrays of at least 4 module strings the fault current can easily exceed the operating current and reach a level that can cause overheating and damage of wire insulation. To ensure the best possible protection for the system and people working on the equipment, each string of solar panels must be protected with a fuse on each pole. They will also isolate the faulted string so that the rest of the PV system can continue to generate electricity.

It must be considered that polarities neither + nor – in photovoltaic equipment are connected to the earth, each chain of modules has therefore to be fitted with two

fuses: one fuse on the positive output and one fuse on the negative output.

It should also be reminded that in operation, fuse links, like thermal devices, are influenced by ambient temperature. The current capability of the PV fuse links shall therefore be derated according to their corresponding Temperature Derating Curve.

When a fault occurs in the DC circuit of the PV installation, the absence of natural zero voltage makes the interruption of DC faults more difficult than the interruption of AC faults as only the fuse arc will force the current to decrease to zero.

The correct interruption depends on three parameters:

- 1.The value of the DC voltage
- 2.The value of the ratio L/R (time constant) of the fault path
- 3.The value of the fault current

Due to the unique requirement in PV systems of having to clear a very low level fault, it is important that a fuse with full range capability is used. This means that the fuse is designed for clearing overloads as well as short circuit faults and requires the use of a fuse with a gPV characteristic.

In order to calculate the best fuse for a general recommendation, the following information is required:

- The array open circuit voltage (with the temperature coefficient)
- The lowest application temperature
- The ambient temperature
- The MPP-current
- The short circuit current (with temperature coefficient of the short circuit current) of the string
- The number of parallel strings
- The max irradiance

Checklist:

- 1) Taking the fact that the polarities + and – are never connected to the earth (neither one nor the other in photovoltaic equipment) into account, each chain of modules has to be fitted with two fuses: one fuse on the positive output and also one fuse on the negative output.
- 2) The first rule has to be applied when the number of chains in parallel (N) is equal to or higher than 4. (for 1, 2, 3 parallel chains, the fusing is not necessary).
- 3) The maximum DC operating voltage of the fuse must be higher than or equal to $1.20 \times M \times (Voc\ STC)$.

Calculation method to choose the correct fuse for a PV power system:

Example: 20kW PV installation

Check the datasheet of the module (STC-values):

Voltage at PMAX (Maximum Point of Power)	VMPP = 29.2V
Open Circuit Voltage	VOC = 36.4V
MPP-Current	MPP = 7.9A
Short Circuit Current	ISC = 8.7A

Check the datasheet of the generator (STC-values):

Number of strings N	N = 4
Number of modules per string	M = 22
MPP Array Voltage = UMPP x M	VARRAY = 642V
Array-Open Circuit Voltage = UOC MOD x M	VOC ARRAY = 800V
Temperature inside combiner box	60 °C

1. Evaluation of the fuse rated voltage

Calculate the smallest fuse link voltage:

VP MIN -25 °C (with temperature coefficient of UCO = 0.36%/°C)

VP MIN >= VOC ARRAY x (1+ (25+25) x 0.0036) =945V

taken: VN = 900 V (VP = 1000 V)

At an IMPP – Current of 7.9A and an open circuit voltage of 945V for the string-protection should be using a gPV type fuse such as ADLER A73 range.

2. Evaluation of the fuse rated current

Determine the de-ratings of the fuse:

Ambient temperature of 60 °C 0.84

Cycling factor for full-range fuse-links 0.90

De-rating of multiple encapsulated fuse-holders must possibly be considered.

Calculate:

Smallest fuse rating IN MIN = I MPP / De-rating = 7.9 A / 0.84 / 0.9 10.50A

Next highest available fuse rating IN chosen: 12.00A

Take into consideration:

Reduced fuse rating in the junction box 12A x 0.84 x 0.9 = 9.1A

Check, if the reduced fuse rating is > ISC MOD 9.1A > 8.7 A ()

String short circuit current ISC STRING = ISC x (N-1) ISC STRING" = 26.1A

ISC STRING at 70 °C (with temp. coefficient of ISC with 0.065%/°C)

ISC STRING' = ISC STRING" x (1+ (70-25) x 0.00065) ISC STRING' = 27A

Consideration of max. irradiance

ISC STRING' at 1200 W/m² ISC STRING' = 27x1.2 = 32.4A

Melting time ts of the fuse rating 12A at ISC STRING 30 s

3. Result:

In this case, ADLER's A7332120700 fuse is the best choice. It is a gPV type fuse, has dimensions 10mm x 38mm, is rated at 1000VDC with a rated current of 12A. This will carry the MPP current of 7.9A and will interrupt a string short circuit current of 32.4A in a time of about 30s. Fuse ratings above 12A are possible, but have to be calculated on the above scheme. Accordingly, the cable type and the cross section the maximum overload current IZ has to be considered.

For further advice, please contact ADLER and we will be happy to assist you with the best fuse selection solutions.

EV – Fuse Selection Guide

Fuse products for EV/ HEV applications are relatively new in the industry, they could be regarded as a crossover product between low voltage fuse and automotive fuse. As of current there are no certification standards or industrial regulations defined yet. For our ADLER's EV fuse designs we take references from following industry standards:

- ISO 8820-8
- ISO 8820-1
- AECQ200
- SAE J2781
- JASO D622 – Japan

The following steps shall help you in selecting the correct EV fuse for automotive applications:

Determine the following parameters:

1. **Rated Voltage Vn:** The rated voltage of the fuse shall not be lower than the operation voltage of the system. For EV purposes and quick-charging stations DC fuses must be applied.
2. **Rated Current In:** Calculate the proper rating according to the maximum continuous load current of the system. Take also the automotive application factor in consideration.
3. **Dimensions:** Find the suitable dimensions and mounting method for the application. Mind that automotive grade fuses must be securely fastened, usually bolt mounted.
4. **Wiring, overload capacity:** Determine, if additional cable protection is required. It is recommended that the auxiliary protection matches the cable protection as far as possible.

To calculate the proper fuse current rating for EV purposes, follow the principles for low voltage fuse and take automotive requirements into consideration:

Formula for current rating of the fuse based on Ib:

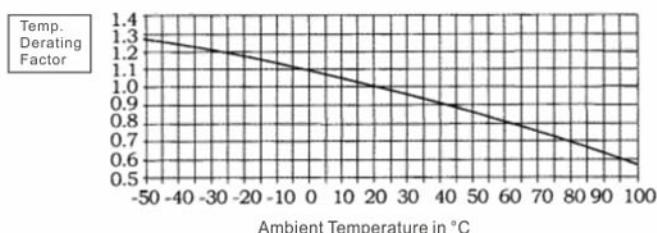

$$Ib = In \times KT \times Ke \times Kv \times Kf$$

Converted to : $In \geq Ib / (KT \times Ke \times Kv \times Kf)$

n: rated current of fuse

Ib: the allowable maximum continuous load current in the circuit, determined by operation current of the application

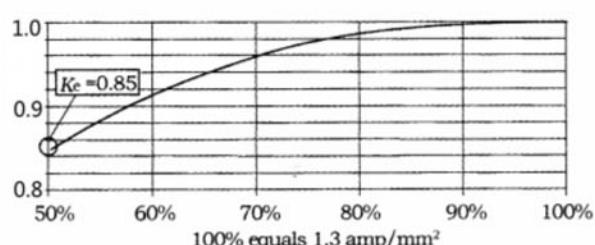

KT: temperature derating factor, determined through measurement of the ambient temperature

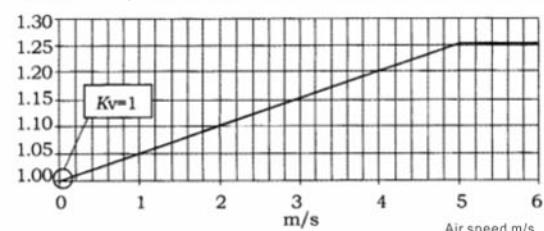

Ke: Heat transfer factor of the connected device

The fuse is generally connected through a copper bar. We can determine the heat transfer according to the current density in the connected copper bolt in the actor correction curve of connecting device heat transfer factor Ke.

Generally, the fuse copper bar has a current density of 1 - 1.6 amp/mm², if the rated current is high, try to adjust the current density to a lower rate.

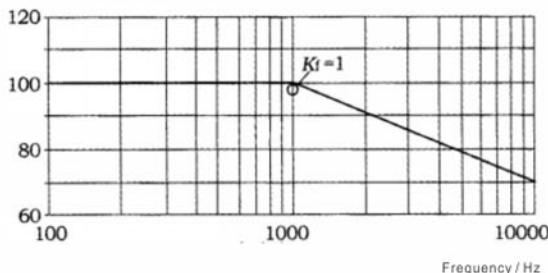

Kv: Forced cooling correction factor:

As is the case with K_t , artificial cooling will affect the operation time of the fuse as well. Natural cooling is the most recommended for EV applications, in that case we have a factor of $K_v=1$

K_f : Frequency correction factor

Below 1000 Hz frequency of the DC current, the K_f value is 1

Based on the variables from the preliminary selection, and taking into consideration the calibration factor 1.6 for electric vehicles, we can now calculate the proper fuse rating:

$$I_n \geq 1.6 \times [I_b / (K_T \times K_e \times K_v \times K_f)]$$

Industrial Power Fuses - Selection Guide

The rated current of the fuse (I_n) is the r.m.s. current which the fuse is able to carry continuously under specified test conditions. It is established by testing the fuse under standard conditions specified in fuse standards (such as UL or IEC). But note that the current rating alone does not provide the user with any information about a fuse's protective characteristics. The temperatures of the various parts of a fuse must be kept within acceptable limits when it is carrying rated current.

The need for circuit protection can be distinguished into two kinds, overload and short circuit situations.

Overload is an excess current passing through the circuit. These currents are usually not much greater than the normal full-load current in the system, but if they are not contained over time they will cause damage to the system, especially to insulating

materials in contact with the circuit conductors.

The heating time in overload situations is relatively long (from seconds up to several hours)

The requirement for a overload protective devices is that it should limit the duration of the overload current.

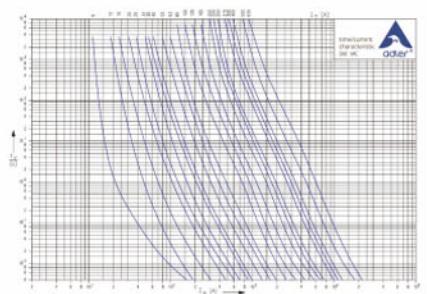

Short Circuits mean the electrical circuit has been forcefully bridged, which could happen because of insulation defects or accidental breakdown. The r.m.s. value of the prospective short-circuit current is very high, typically more than 20 times of the normal full-load current in the system. The heating effect is so intense that damage to the system can occur within milli-seconds. This heating effect depends on the waveform of the current, in which case the requirement for the protective device is to limit the energy associated with the fault,

1 $\int i^2 t$: Instantaneous current [i.e. $i = i(t)$]. This integral is also called « I^2t » and is the measure of the thermal energy delivered to each ohm of the circuit by the short-circuit current during the time t .

A short-circuit fuse or protective device should also limit the peak value of current permitted to run in the circuit. ADLER high-speed fuses open very rapidly under short circuit conditions and provide excellent protection in case of short-circuit faults.

2 I^2t (Time-Current Characteristics):

The time it takes for the fuse element to melt due to heating effect of the current running through the fuse is called pre-arching time, and is followed by a period of arcing. For operation in times less than one AC cycle, the melting time of the element is affected by the current's wave shape. To determine the proper system protection it is necessary to consider the fuse's I^2t values. Below is a standard time current curve for a range of ADLER 500 VAC fuses.

3 Ambient Temperature Derating Factor K_T :

Fuse current ratings are usually determined through standard tests with a reference ambient air temperature θ of 25°C. But in most industrial power applications the ambient temperature is higher than that, rather in the range of 40-70°C. That's why the fuse must be "derated." The temperature rise in the fuse is forced by the internal power generation, which is a function of the square of the current. So, for a real ambient temperature value θ the current rating must be multiplied by a special de-rating coefficient K_T , considering the maximum allowable fuse temperature T_{max} (typically 130-150°C)

$$K_T \sqrt{\frac{T_{max}-\theta}{T_{max}-\theta_A}}$$

4 Forced Cooling Correction Kv:

If the application uses forced air to cool the fuse, the continuous current rating of the fuse may be increased, by multiplying the rated current by a coefficient, Kv. The limiting value is typically 1.25, but values higher than this can be adjusted for special purpose fuse designs.

5 High Frequency Coefficient KF:

If the current in the circuit contains high-frequency components with more than 1kHz, the current distribution in the fuse will be effected by electromagnetic field interactions. This results in additional heating and should be considered through a coefficient KF:

f (Hz)	Kf
0 < f ≤ 100	1.00
100 < f ≤ 500	0.95
500 < f ≤ 1500	0.90
1500 < f ≤ 5000	0.80
5000 < f ≤ 10000	0.70
10000 < f ≤ 20000	0.60

6 Load Current Coefficient KTL:

In industrial power equipment the r.m.s. current through the fuse usually varies depending on the load and duty cycle when it is in operation. Also, power conversion equipment can be switched on and off from time to time.

The heating and cooling of the fuse elements due to this loading can cause mechanical deterioration and nuisance opening of the fuse. This is especially important for semiconductor and ultra-high speed fuses.

Variations in the load current and duty cycle are taken into account by using a derating coefficient KTL. Loads can be classified as continuous or cyclic.

Continuous load means that the load current remains steady when the equipment is in operation, no overloads occur. For a few stops per year the KTL will have minor effect at about 0.95. For daily stops (such as overnight shutdowns) the KTL will be 0.9. For frequent daily stops the KTL shall be considered as 0.8.

If the current load cyclic, which means it repeatedly switches on and off, the temperature fluctuation is even large and KTL must be 0.6 or lower.

This formula combines the discussed values and derating factors:

$$I_b = I_n \times K_T \times K_V \times K_F \times K_T L$$

Converted to : $I_n \geq I_b / (K_T \times K_V \times K_F \times K_T L)$

Application

ADLER's ASPD Series PV DC Surge Protection Device are designed and manufactured complying to PV standard EN50539-11. It is widely used in PV DC combiner boxes, inverters, controllers and DC cabinets. With a rated voltage of 1000V DC, a maximum discharge current of 40KA and the integrated high-energy varistor provide highly effective protection against lightning and surge voltages.

Wiring Instructions

Dimensions(mm)

3 Photovoltaic System Components

- PV Holders
- PV Combiner Boxes
- DC Isolator Switches
- DC Circuit Breakers

BH100 & BH101 Holder

FEATURES:

ADLER BH100 and BH101 holders are designed for A73 series and standard 10x38mm PV fuses. The BH101 holder is equipped with a red indicator light. It will light up when the inserted fuse is blown.

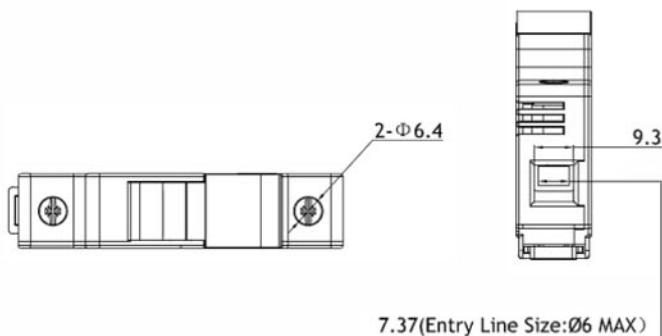

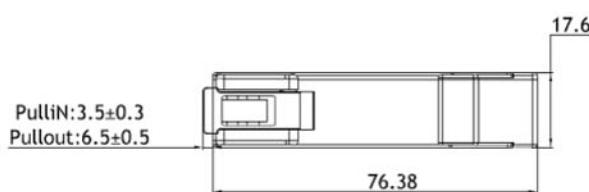

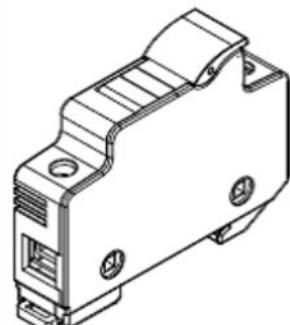

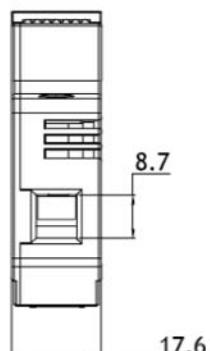

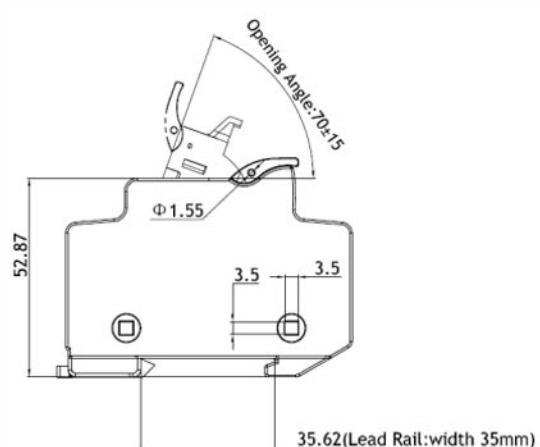

DESCRIPTION:

The BH100 and BH101 holders apply to 10x38mm miniature fuses.

SPECIFICATIONS:

- Rated Voltage: 1000 VDC/600VDC
- Rated Current: 0-50A
- Withstand rating, DC Amperes: 30KA/10KA
- Material Flammability:
UL 94-V0 (PBT)/ UL91-V2 (PA6)
- Neon Light Indicator in case of over-current fault (optional): min 90VAC
- Mounting: DIN Rail mounting
- Wire diameters: 0.8mm² – 6.0mm²
- Ambient temperature: -40°C ~ +130°C

DIMENSIONS: mm

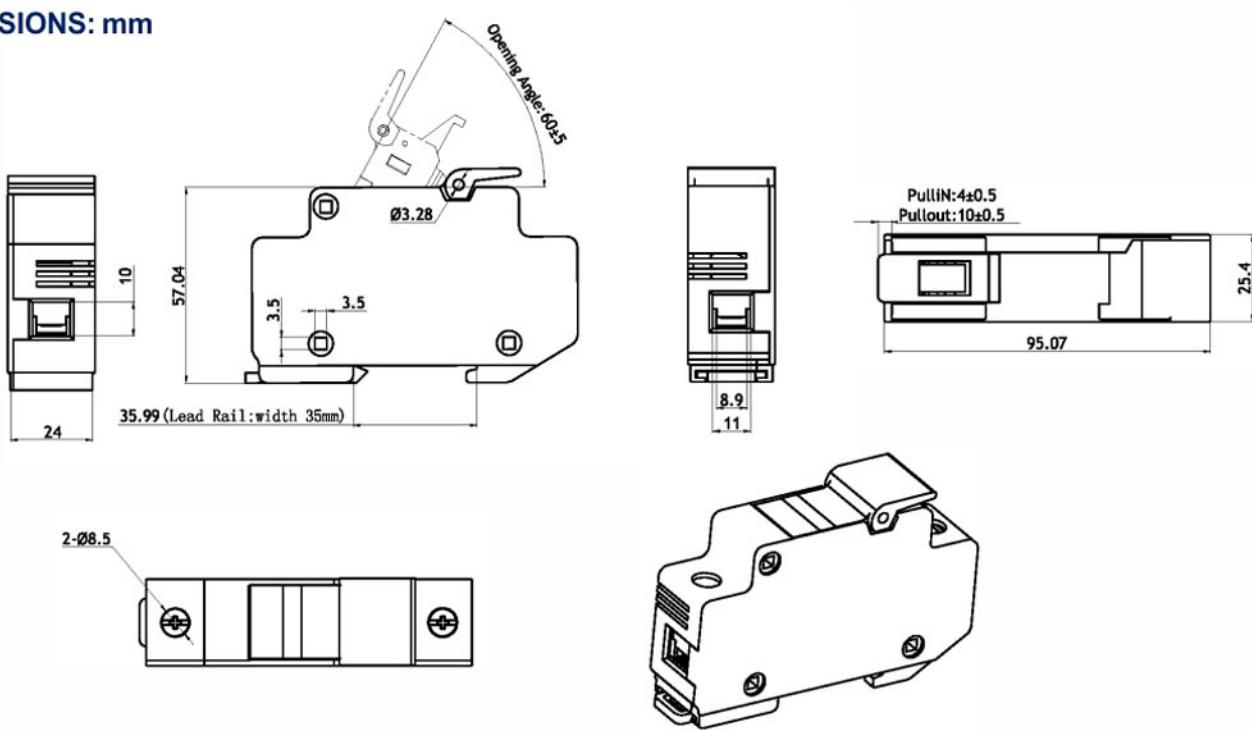

BH200 Holder

FEATURES:

These holders, in conjunction with APC fuse, are the effective solution to safely reference modules from reserve over current conditions. Rated for up to above 50 Amps and 690VAC, this holder, could supply a cost-effective solution to protect circuit overload, short(gG), motor circuit(aM) and semi-conductor or sets equipment(aR).

DIMENSIONS: mm

BH300 Holder

FEATURES:

These holders, in conjunction with BH300 fuse, are the effective solution to safely reference modules from reserve over current conditions.

Rated for up to above 30 Amps and 1500VDC, this holder, could supply a cost-effective solution to protect circuit overload, gPV

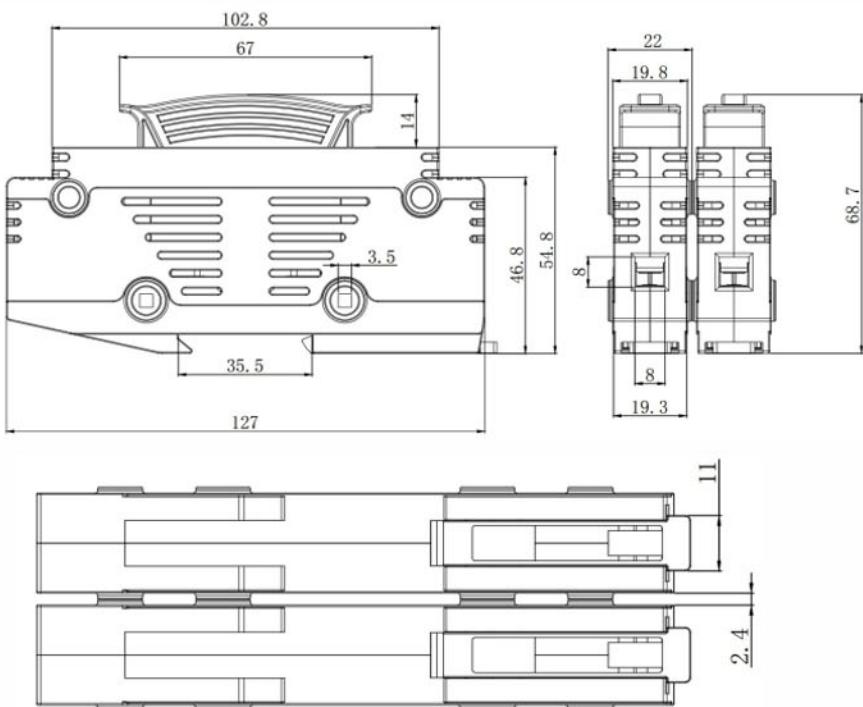

DESCRIPTION:

The BH300 applies to 10x85mm fuse.

SPECIFICATIONS:

- Rated Voltage: 1500 VDC
- Rated Current: 0~30A
- Breaking Capacity: 10KA/1500VDC
- Manufacturing Standards: IEC60269; GB13539; RoHS compliant
- Material Flammability: UL 94-V0 (PBT) / UL91-V2 (PA6)
- Wire Range: 2.0mm²~13.3mm²
- UL file: pending

DIMENSIONS: mm

BH112 Fuse Holder

FEATURES:

Adjustable mounting hole, easy to install with screws or bolts
Combination slide-on design to stack in series
Designed for general purpose fuse ratings

DESCRIPTION:

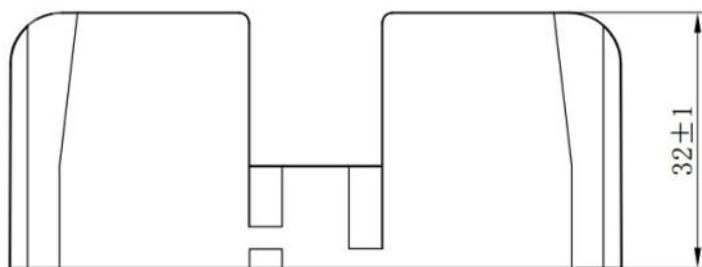

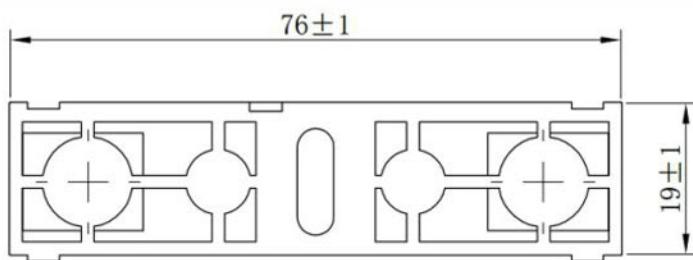

This BH112 holder made of thermoplastic is designed for 10x38mm cylindrical fuses and allows for easy mounting on flat surfaces.

Please note, BH112 cannot be mounted on DINR constructions.

SPECIFICATIONS:

- Thermoplastic meets UL94 V-0 flammability standards
- Rated Voltage: 600VAC / DC
- Maximum Current: 30A
- Dielectric strength: >1200 V
- Clip/terminals : Tin-plated copper alloy
- Screw and captive pressure plate: Zinc-plated steel
- Base Temperature: 125°C
- Torque: 4nm (35 in-lbs)
- Wire Range: 6-14 AWG

DIMENSIONS: mm

BH114 Fuse Holder

FEATURES:

Adjustable mounting hole, easy to install with screws or bolts

Combination slide-on design to stack in series

Designed for general purpose fuse ratings

DESCRIPTION:

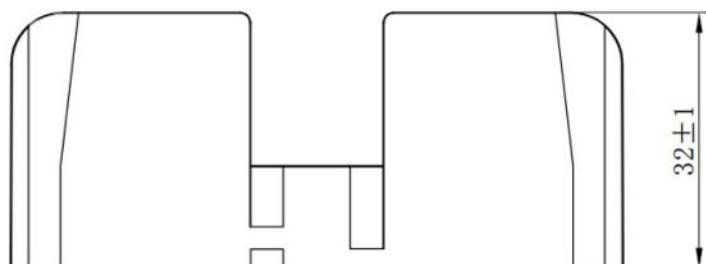

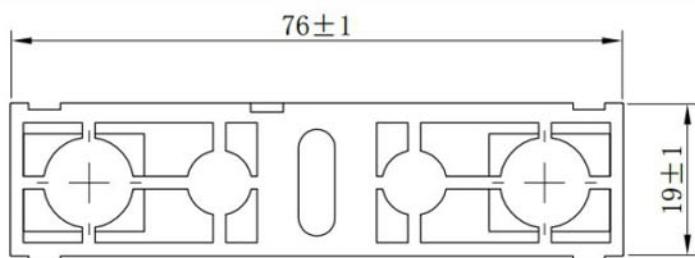

This BH114 holder made of thermoplastic is designed for 10x38mm cylindrical fuses and allows for easy mounting on flat surfaces.

Please note, BH114 cannot be mounted on DINR constructions.

SPECIFICATIONS:

- Thermoplastic meets UL94 V-0 flammability standards
- Rated Voltage: 600VAC / DC
- Maximum Current: 30A
- Dielectric strength: >1200 V
- Clip/terminals : Tin-plated copper alloy
- Screw and captive pressure plate: Zinc-plated steel
- Base Temperature: 125°C
- Torque: 2.3nm (20 in-lbs)
- Wire Range: 10-14 AWG

DIMENSIONS: mm

ACB PV Array Combiner Boxes

- **Efficient Protection Grade IP65/66**

The ADLER ACB Combiner box is waterproof, dust proof and anti-corrosive, it withstands harsh environmental exposure.

- **PV Solar string Current Aggregation**

Multiple strings input, one string output, Available for 1~24 strings, Max current 30 A per string.

- **Effective Isolating**

ADIM Series Isolator Switches, current 16 A to 630A, Max voltage up to 1500V DC, widely meet the various demands from PV power systems.

- **Lightning Protection**

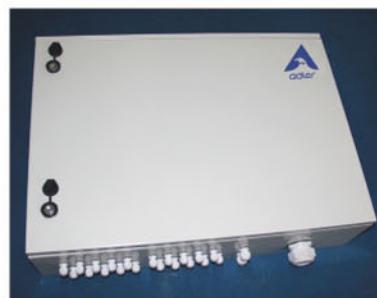

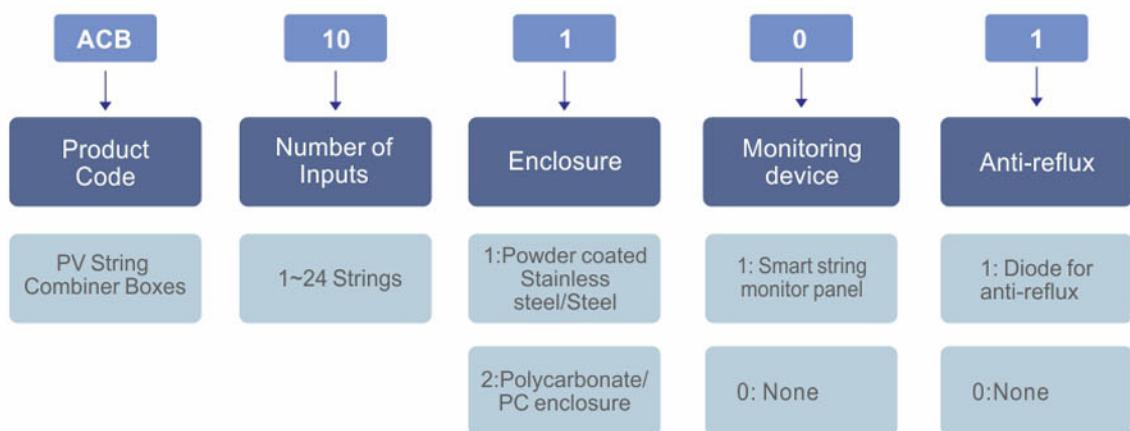

ASPD-40 Surge protector device with plug-in design, up to 1000V DC, 40KA,with lightning protection for PV power system.

- **Over-current Protection and Short-circuit Protection**

A73 fuse links with B100 touch-safe holders (optional with LED indicator) for over current protection.

ADCM and ADCR series circuit breaker, for optimal and precise short-circuit protection and over current protection, with Max current up to 630A,Max voltage up to 1000 V DC.

Model Number Definitions

Application

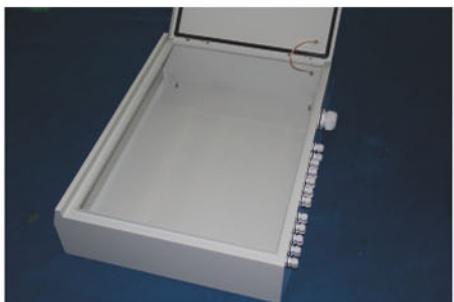

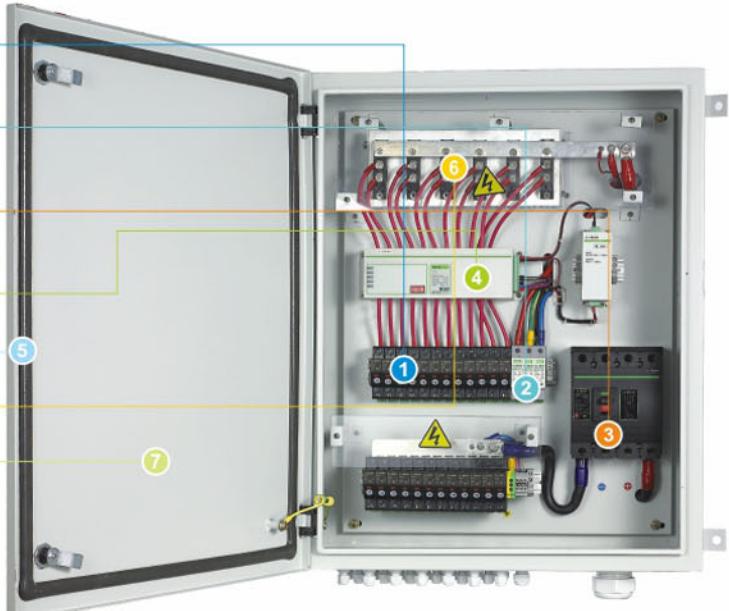

PV String DC Combiner Boxes are key components in the PV Solar power systems, they are placed between Solar Modules and the DC Inverter.

Features

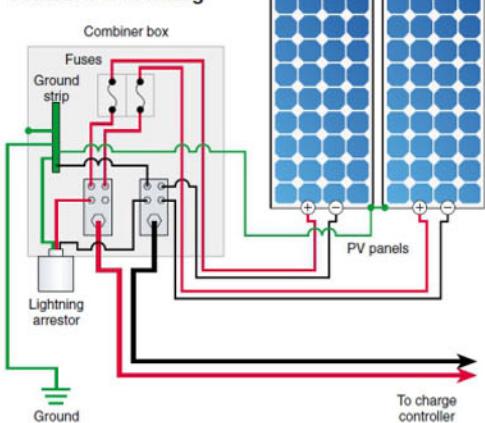

- Simplified physical wiring between solar panel and inverter
- Fault current protection for each PV String
- Fault alarm
- Easy installation and maintenance

Structure diagram

- 1 A73 Fuse links and B100 or B101 PV fuse holder with LED indication light, 1000V DC 25/ 30A
- 2 ASPD-40 triple surge protection device, plug-in design, up to 1000V DC 40KA
- 3 ADCM series Circuit breakers, 1000V DC Max current 630A, meets standard demands for PV systems
- 4 Smart monitoring device (wireless communication can be attached)
- 5 Drop-in rubber rims for superior moisture resistance
- 6 Diode with Anti -Reflux function
- 7 Powder Coated steel(Powder coated stainless steel / Polycarbonate enclosure optional) Protection up to IP65/IP66, customized solutions

Combiner Box Wiring

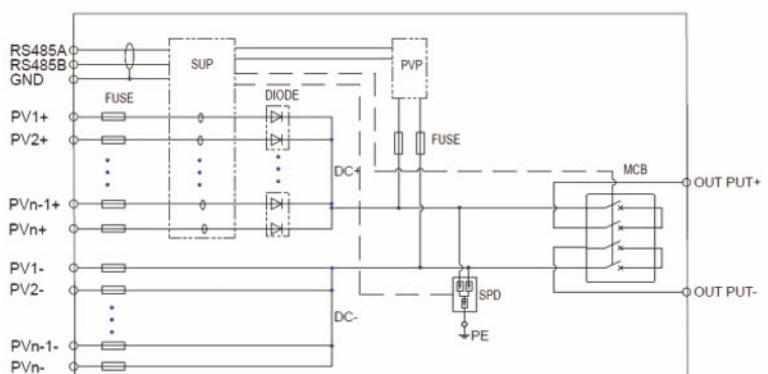

Advantage of Polycarbonate enclosure

- Very high impact resistance
- Easy machining with normal tools
- Ip66
- Wide operation temperature range
- Fire Resistance
- Non-conductive
- Good resistance to chemical corrosion
- Light weight
- Good UV resistance
- Excellent insulating properties
- Cost-effective material for harsh environments

Advantage of Powder coated Stainless steel/Steel enclosure

- Thickness $\geq 1.5\text{mm}$; powder coated; cold rolled steel
- Surface finish: sand blasted and parkerised 80-120 μm
- Ip65 waterproof, dust proof, anti-corrosion and UV resistance
- Durability: ACB series combiner boxes are built to withstand harsh environmental exposure
- Suitable for long distance transport

ADIE Series Enclosed PV DC Isolator Switch

Features

- Compact construction
- pre-wired DC Main Switch with MC4(optional)
- UV resistant, IP66 enclosure
- Arcing time < 3ms
- "OFF" position Lockable
- IEC60947-3 Standard
- 4P,6P
- DC-21B: 16A,25A,32A up to 1500VDC

ADIE - 1000V DC Isolator Switch

Model Numbering Definitions

ADIE - 1200V DC Isolator Switch

Application

ADLER's ADIE Series DC Isolator Switch in plastic enclosure is applied to 1-20kw residential and commercial PV systems, it is installed between solar panels and inverter. It's arcing time of less than 3ms is the key

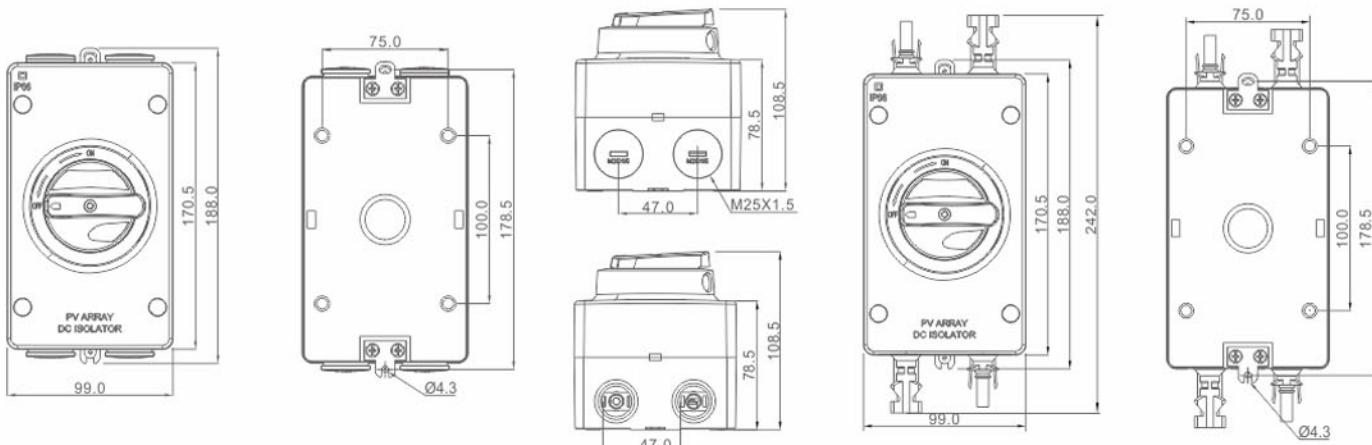

advantage of the switch and safety. Top material and highest PV test standard ensure high quality isolator switch and long working life.

ADIS Series PV DC Isolator Switch

ADIS-1 1200V DC Isolator Switch

- Rated Voltage 1200V DC
- Single Hole Mounting Ø22mm
- Flame-Retardant
- Arcing Time < 3ms
- IEC60947-3
- 4 poles(Single|Double Strings Available)
- DC-21B: 16A,25A,32A up to 1200V DC

ADIS-2

ADIS - Standard 1200V DC Isolator Switch

Application

ADLER's ADIS series DC Isolator Switches are designed for installation in 1-20KW Inverters, Controller, DC Combiner Boxes.

They are used for Residential or Commercial PV solar power system(on-grid/off-grid). With their arcing time of less than 3ms they effectively disconnect all standard PV solar systems.

ADIS-3 1200V DC Isolator Switch with OFF-Lock

- DIN Rail Mounting
- BYT.2 -32 Rated Voltage 1200V DC
- OFF - Lock
- Flame-Retardant
- Arcing Time < 3ms
- IEC60947-3
- 4Poles(Single|Double Strings Available)

Installation Environment							
Ingress Protection		IP20					
Rotation Angle for Knob		90°					
Operation Temperature		-30°C~+70°C					
Mounting	Standard Din rail/Panel Mounting/Fixed installation						
Use Categories	DC-21B						
Resistance to Humidity and Heat	II						
Altitude	<2000m						
Relative Humidity	When Temperature arrived to 20°C, Relative Humidity ≤95%, Temperature arrived 40°C, Relative Humidity ≤50%						
Pollution Degree	3						

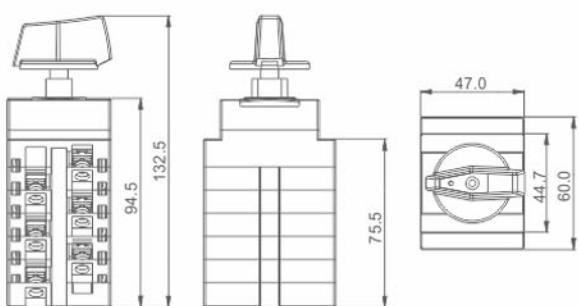

Application

ADLER's ADII series DC Isolator Switches are designed as one of the most important components in PV solar power systems, in applications between 1KW to 20 KW, especially for Inverters, Controllers and Solar DC Combiner Boxes. Maximum Voltage is up to 1500V DC, Rated Current 32A, combining innovative design with a compact structure.

ADIH Series PV High-Current DC Isolator Switch

CB

Features

- Breaking Power Optimized Across The Entire Current Range.
- Visible Contacts
- Simplicity in Installation
- Padlockable in The "OFF" Position and with Door Interlock in The "ON" Position
- Adjustable Shaft for a Depth of Installation Ranges
- DC21B:160A,200A,250A with Operational Voltage of 1000V DC

ELECTRICAL CHARACTERISTICS

Total Cleaning I ² t	Arc Voltage	Power Loss
The total clearing I ² t at rated voltage and at power factor of 15% are given in the electrical characteristics. For other voltages, the clearing I ² t is found by multiplying by correction factor, K, given as a function of applied working voltage, Eg, (rms).	This curve gives the peak arc voltage, UL, which may appear across the fuse during its operation as a function of the applied working voltage, Eg, (rms) at a power factor of 15%.	Watts loss at rated current is given in the electrical characteristics. The curve allows the calculation of the power losses at load currents lower than the rated current. The correction factor, Kp, is given as a function of the RMS load current, Ib, in % of the rated current.

Time Current with AE7xxxxi02

AE8 EV Fuse

FEATURES:

- Rated Voltage: 800 VDC
- Rated Current: 200~400A
- Rated Breaking Capacity: 10 kA
- 800VDC ideal for EV or HEV application
- Fast Acting fuse for EV/HEV, e-Bus and charging stations
- Special designed fuse base for automotive use

AE9 EV Fuse

FEATURES:

- Rated Voltage: 700VDC
- Rated Current: 5~100A
- Rated Breaking Capacity: 10 KA
- 700VDC ideal for EV or HEV application
- General purpose fuse for EV/HEV, e-Bus and charging stations
- Special designed fuse base for automotive use

BHE01 Holder

FEATURES:

ADLER BHE01 holders are designed for AE1 series fuse.

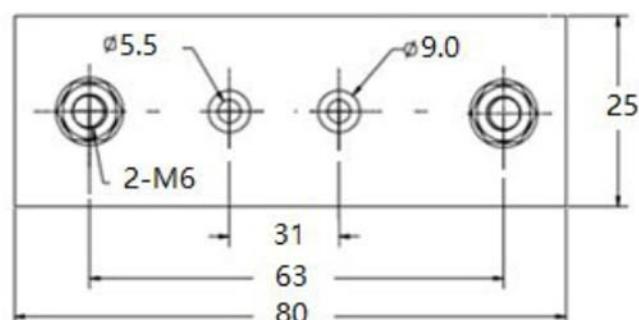

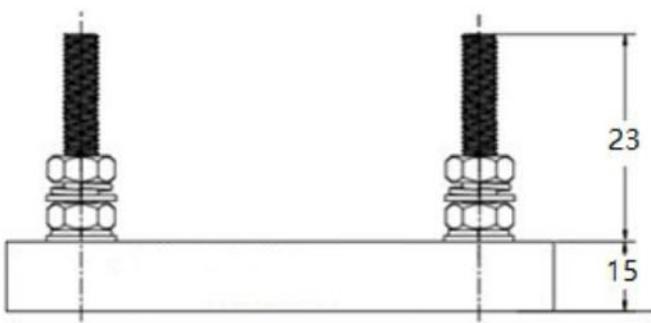

DESCRIPTION:

The BHE01 is suitable for use with automotive equipment, and ADLER AE1 EV fuse links.

SPECIFICATION:

- Rated Voltage: 500V AC/DC
- Max. Current: 700A
- Operating temperature: -40°C ~ +120°C
- Pressure: 13~18KV
- Insulation Board Material:
Phenolic\ resin laminate
- Insulation Resistance: 50, 000 MΩ
- Metal Material : stainless steel,
carbon steel
- UL-94 Flame retardant grade : 94HB

DIMENSIONS: MM

Note:

- (1)The bolt length 23 can be adjusted according to need.
- (2) The mounting holes distance 31 can be adjusted according to need.

BHE02 Holder

FEATURES:

ADLER BHE02 holders are designed for AE7, AE8, AEB series fuse.

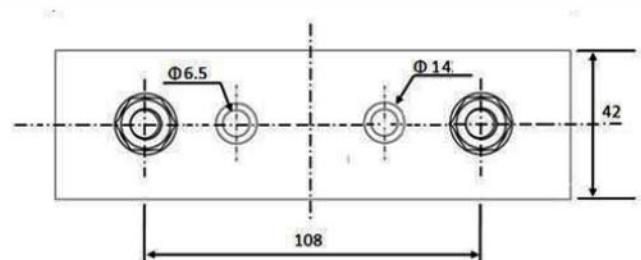

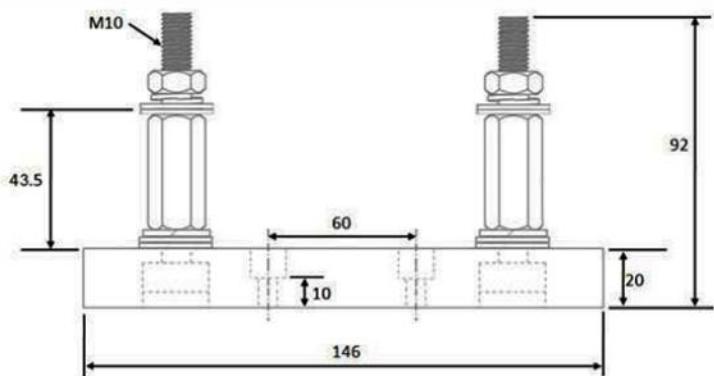

DESCRIPTION:

The BHE02 is suitable for use with automotive equipment, and ADLER AE7, AE8, AEB EV fuse links.

SPECIFICATION:

- Rated Voltage: 1000V AC/DC
- Max. Current: 700A
- Operating temperature: -40°C ~ +120°C
- Pressure: 13~18KV
- Insulation Board Material:
Phenolic\ resin laminate
- Insulation Resistance: 50, 000 MΩ
- Metal Material : stainless steel,
carbon steel
- UL-94 Flame retardant grade : 94HB

DIMENSIONS: MM

Note:

The mounting holes distance 60 can be adjusted according to need.
